*Heterogenous computing*

# Overview

- Motivation
- Parallel software
  - Data-par <https://eduassistpro.github.io/>
  - Task-par Add WeChat edu\_assist\_pro
- Heterogenous computing

# Motivation

- Programming computers composed of a combination of CPUs, GPUs, and other processors
- Write single programs on wide range of systems
  - Cell phones
  - Laptops
  - Nodes in massive supercomputers
- High portability by *exposing* hardware

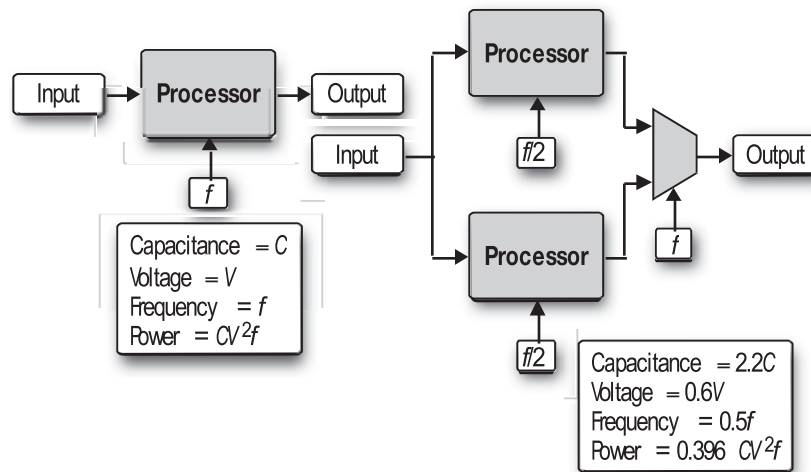

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# Motivation

- Raw performance used to drive innovation
- Focus now performance delivered per watt expended
- Many cores at lower frequencies more power efficient
- Will continue to <https://eduassistpro.github.io/> onto single die
- But now will co <https://eduassistpro.github.io/> instead of raw performance
- Microprocessors built from multi <https://eduassistpro.github.io/> power cores

# Concurrency/parallel software

- Parallelism = concurrency enabled by hardware
- Challenge for programmers:
  - find concurrency in problem
    - can be as simple as executing independent stream of operations for each pixel in i
    - can be incremented streams of operations that share information and must trigger their execution
  - express concurrency in software
    - streams of operations that will execute concurrently must be defined
    - data they operate on associated with them
    - dependencies between them managed so that correct answer is produced when they run concurrently
  - run resulting program so that concurrency delivers desired performance

Assignment Project Exam Help

# Parallel programming

- This is the crux of the parallel programming problem
- Key to parallel programming: high-level abstraction or model to make problem more manageable
  - <https://eduassistpro.github.io/>
  - Add WeChat edu\_assist\_pro
- Task parallelism
  - E.g., problems organized around updates over points on grid
- Data parallelism
  - E.g., problems expressed as traversals over graphs

# Data-parallel programming

- Programmers think of their problems in terms of collections of data elements that can be updated concurrently
- Parallelism expressed by concurrently applying the same stream of instructions to each element
- Parallelism is in

Assignment Project Exam Help

Add WeChat edu\_assist\_pro

# Task-parallel programming

- Directly define and manipulate concurrent tasks
- Problems decomposed into tasks that can run concurrently, with processing elements (PEs) <https://eduassistpro.github.io/>
- Easiest when tasks completely independent but is also used with tasks that share data
- Tasks vary widely in computational demands, so distributing them so that they all finish at about the same time can be difficult: **load balancing**

# Task-parallel programming

Add WeChat edu\_assist\_pro

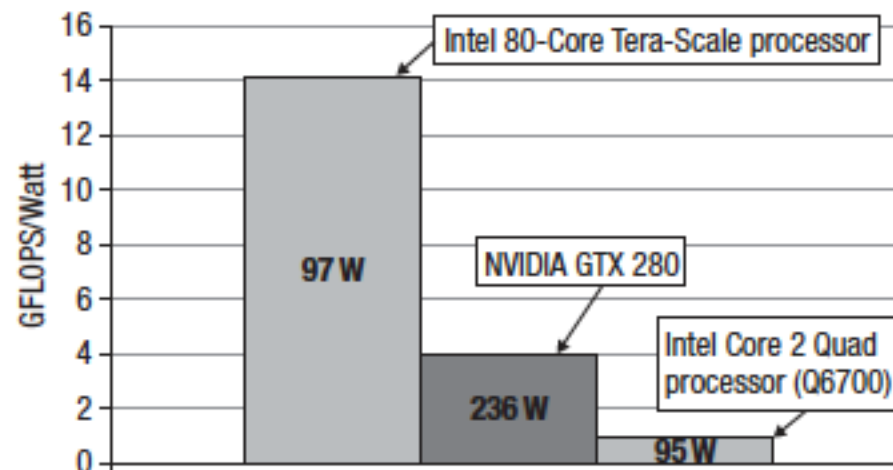

# Heterogenous computing

- General-purpose processor:
  - wide range of functional units to respond to any computational demand
- Processors specialized to a specific function:
  - fewer wasted transistors
  - include only the functional units needed for their special function

Add WeChat edu\_assist\_pro

# Heterogenous computing

- Regardless of programming model, next step = map program onto real hardware

## Assignment Project Exam Help

- Here, heterogeneous problems present unique  
<https://eduassistpro.github.io/>

## Add WeChat edu\_assist\_pro

- Computational elements in :
  - have different instruction sets
  - have different memory architectures
  - run at different speeds

# Heterogenous computing

- Traditionally:
  - think of software as set of modules implementing distinct portions of problem
  - modules explicitly tied to components in heterogeneous platform
  - E.g., graphics software runs on CPU
  - General-purpose software broke this model
  - Algorithms outside of graphics wanted to fit onto GPU
- Hardware heterogeneity complicate
- Programmers depend on high-level abstractions that hide complexity of hardware
- Heterogeneous programming language exposes heterogeneity and is counter to the trend toward increasing abstraction

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# Heterogenous computing

Application for heterogeneous platform must:

1. Discover components that make up heterogeneous system
2. Probe character software can adapt to specific elements
3. Create blocks of instructions at will run on platform
4. Set up manipulate memory objects involved in computation
5. Execute kernels in correct order and on correct components of system
6. Collect final results
